

Abstract

Title of the invention: A control unit for a light source in combination with spray
defense container

A control unit in combination with a conventional self-defense spray container represents a combined light emitting and spray discharging self-defense device. The unit comprises a housing for a light source having a lower prismatic portion, a sleeve for securing the housing to a self-defense spray container and a cover coupled with the housing and having a free portion to support a battery source. The unit further comprises means for rotational mounting the cover on the housing at the coupling portion of the cover, an electrical circuit for connecting the battery source to the light source and a switch associated with said housing and said cover for closing and opening said electrical circuit.
